Information Strategy and Services
University of Colorado Anschutz
13001 East 17th Place
Aurora, CO 80045

Dear Hiring Committee:

RE: Senior AI & Business Enablement Partner

I co-lead the Innovation Center at Glendale Community College for seven years: the platforms, the developers, the service agreements, and the evaluations and requests for proposal behind the college's technology decisions. Today I co-chair a domain of the AI Resource Center at the Maricopa Community Colleges, one of the largest community college districts in the country, with ten colleges and more than 140,000 students, where my work is mapping how a service runs, finding where AI can take routine work off staff, and moving what holds up into a pilot with defined success measures.

I designed and built the intake for that work: a submission pipeline that takes both what a college already has and what it wants, scores each across six dimensions, and sorts the result into four dispositions: this becomes a pilot, this needs more discovery, this is a training problem rather than an AI problem, and this we decline. It is built, and the request track opens once the inventory is complete, so it has not taken its first request yet. I am currently running a ten-college study to find where agentic workflows can remove routine work from advising staff, and evaluating candidate solutions against what it surfaces, including meeting student-success platform vendors at EDUCAUSE next week. I also wrote the framework, now in review with the district AI CIO, for moving an approved idea into a sandboxed pilot and then into production so that nothing remains in pilot indefinitely. The domain is a year old and this work is early.

- **Bachelor's degree in Education or a closely related field.** I hold a Master of Education in educational technology from Northern Arizona University. My bachelor's degree is in visual communications. That degree started me in identity systems and website interfaces, and it is still why I design the form, the briefing, and the interface myself instead of specifying them for someone else.
- **Two or more years leading projects and initiatives as a project manager, project lead, or similar role.** Seven years co-leading the Innovation Center, where I managed cross-functional development teams to delivery on time and within budget, ran a platform evaluation and request for proposal against vendor alternatives, and stood up the campus-wide single point of contact helpdesk. Before that, three years as a product manager for web-delivered education software, setting the roadmap with engineering, sales, and marketing and building integrations with partner platforms including Blackboard and WebCT.
- **One to two years supporting business analysis through requirements gathering, process mapping, stakeholder engagement, and workflow analysis.** As a product manager I wrote the requirements engineers built from and ran the usability studies behind them. At the Innovation Center I defined requirements and wrote ITIL service agreements. Now I am building a cross-college service map, in draft and out to campus representatives for verification, because the same service carries a different name at every college and a problem stalling students at one campus often already has a working process at another. Alongside it, I built a journey study run by 52 AI agents, fifty of them playing student personas, that work through real tasks on each college's own systems and record where students get stuck. Rating those barriers by severity shows where automation could help and where a student needs a person.
- **One to two years working with or supporting AI technologies, workflow automation platforms, and digital solutions.** Over the past year I have built and run scheduled AI agents on the Claude API with Google Apps Script and Sheets that take routine searching and checking off a person entirely, a student career platform entering its first pilot this fall, a multilingual support routing tool in a program-wide pilot, and a course quality suite whose core checks are deliberately rule-based with no model in them, so the same input returns the same answer every time.
- **Experience working in or supporting higher education or technology-focused organizations.** More than twenty-five years in higher education, plus three years inside an education technology company. At the district level I co-chair the Student Support and Success domain of the Maricopa AI Resource Center and sit on its steering committee, which is where the intake, the service map, and the journey study above come from. I also served on the cross-domain team that produced the district's student AI explainer, released to all ten colleges, and earlier co-lead the learning platform committee for the ten-college system.
- **Change management, communication, training, and adoption strategies.** I brought a campus onto its first learning management system, starting with no platform, no standards, and no faculty using one. I led more than 45 faculty to fully online teaching in weeks during the pandemic, co-authored the proposal that established the college's teaching and learning center, designed and taught a faculty development course on teaching online, ran an eight-year professional development series, and have coached faculty individually as a Quality Matters and OSCQR lead reviewer since 2011. Most recently I convened a campus AI community of practice: early adopters from faculty, staff and administration, formed to demonstrate the practice rather than to document it.

- **Translating complex technical concepts into accessible language for non-technical audiences.** When I share the tools I build with colleagues, in AI Resource Center meetings and in our campus AI community of practice, I explain in plain terms how each one works, what it connects to, and what data it handles.

I would welcome the opportunity to discuss where I could contribute.

Sincerely,

Michelle Blomberg
